

The following message and request is from our own Dr. Paul Koch. Please consider helping him by taking a few minutes and completing the survey.

The last ten years have seen the development of several bentgrass cultivars with increased resistance to dollar spot. However, these resistant cultivars are not always selected when new golf courses are built or courses are renovated. As part of a multistate, multipronged research effort to improve dollar spot control we have created a short survey to help turfgrass researchers and breeders better understand the factors that superintendents use when deciding which cultivar or cultivars to plant on their course. The results of this survey will provide critical information that will be used in the development and implementation of future disease-resistant grasses. If you manage cool-season turf and are involved in the agronomic decisions at your golf course we urge you to complete this short 10-minute survey to help us in our research.

A link to the survey can be found
